Chapter 6.01 — Spring 2011 — April 25, 2011 1

## 6.01 Course Notes Spring 2011

<a href="#">1</a>	<a href="#">Course Overview</a>	<a href="#">6</a>
<a href="#">1.1</a>	Goals for 6.01	6
<a href="#">1.2</a>	Modularity, abstraction, and modeling	7
<a href="#">1.2.1</a>	Example problem	7
<a href="#">1.2.2</a>	An abstraction hierarchy of mechanisms	8
<a href="#">1.2.3</a>	Models	12
<a href="#">1.3</a>	Programming embedded systems	15
<a href="#">1.3.1</a>	Interacting with the environment	15
<a href="#">1.3.2</a>	Programming models	17
<a href="#">1.4</a>	Summary	19
<a href="#">2</a>	<a href="#">Learning to Program in Python</a>	<a href="#">20</a>
<a href="#">2.1</a>	Using Python	20
<a href="#">2.1.1</a>	Indentation and line breaks	21
<a href="#">2.1.2</a>	Types and declarations	22
<a href="#">2.1.3</a>	Modules	23
<a href="#">2.1.4</a>	Interaction and Debugging	23
<a href="#">2.2</a>	Procedures	24
<a href="#">2.3</a>	Control structures	26
<a href="#">2.3.1</a>	Conditionals	26
<a href="#">2.4</a>	Common Errors and Messages	34
<a href="#">2.5</a>	Python Style	36
<a href="#">2.5.1</a>	Normalize a vector	36
<a href="#">2.5.2</a>	Perimeter of a polygon	37
<a href="#">2.5.3</a>	Bank transfer	38
<a href="#">2.5.4</a>	Coding examples	39

# MDX CSD 1000

- 1 The really (in)famous precedent
- 2 The context**
- 3 Racket & Mirto
- 4 Applications
- 5 Assessment & Evaluation

# Computer Science at Middlesex University

- New Computer Science programme for the academic year 2013/2014
- Teach students how to become autonomous learners
- *Racket*: solid mathematical background and language-independent programming skills
- *Real hardware*: Arduino, Raspberry Pi, and the Robotic Platform *Mirto*
- Completely revised delivery and assessment methods:
  - ▶ no modules or courses
  - ▶ activities run seamlessly across the projects
  - ▶ Assessment through *Student Observable Behaviours* (SOBs).

# Week structure

- **General Lecture:** introduction to topic and related project;
- **Design Workshop:** design skills in software or hardware, systems engineering (UML), HCI, security;
- **Programming Workshop:** exercises, master-classes, coaching sessions, restricted to Racket;
- **Physical Computing Workshop:** from simple logic gates to microcontrollers (Arduino) and other specialist devices controlled through Racket;
- **Synoptic Workshop:** 4 hours to investigate foundations, design, build, test and discuss projects.

- 1 The really (in)famous precedent
- 2 The context
- 3 Racket & Mirto**
- 4 Applications
- 5 Assessment & Evaluation

# Three Projects

- 1 traffic light system
- 2 dungeon game
- 3 Middlesex RoboTic PlatfOrm – MIRTO

# The Platform

- Base platform:
  - ▶ two HUB-ee wheels with motors and encoders (to measure actual rotation)
  - ▶ front and rear castors
  - ▶ two bump sensors
  - ▶ an array of six infra-red sensors
  - ▶ a rechargeable battery pack
  - ▶ an Arduino microcontroller board
- Top layer:
  - ▶ a Raspberry Pi connected to the Arduino
  - ▶ Linux with Racket (current version 5.93)
  - ▶ USB-WiFi adapter for SSH and network
  - ▶ Additional: cameras, microphones and text to speech with speakers

- Library developed by the teaching team
- Takes care of low-level serial communications  

```
(send-sysex-int-msg #x7D 5 power)
```
- Students deal only with high-level Racket programs  

```
(define (setMotors speed1 speed2)  
  (setMotor 0 speed1)  
  (setMotor 1 speed2))
```
- Students can read IR values with  

```
(getIR 2)
```

- 1 The really (in)famous precedent
- 2 The context
- 3 Racket & Mirto
- 4 Applications**
- 5 Assessment & Evaluation

# Line-following with PID

```
(define proportional (- error 2000))

;; Integral component: we reset to 0 when error is 0
(cond ( (= 0 proportional) (set! intError 0))
      (else (set! intError (+ intError proportional))))
)

;; we assume dt constant, so this is just the difference
;; If derivative < 0, we moved to the left of the line
(define derivative (- proportional (- prevError 2000)))
(set! prevError error)

;; The correction is the sum of a proportional component,
;; integral component and a derivative component.
(define correction (+ (* Kp proportional)
                    (* Ki intError)
                    (* Kd derivative)) )

(cond

  ((> correction 0) ;;we are to the right
   (setMotors PWR (- PWR correction)))

  (else ;; we are to the left
   (setMotors (+ PWR correction) PWR))

)
```

- Speech-recognition: PocketSphinx connected to Racket
- Graphical Interface using X on Pi
- Web-server running on Pi
- Twitter controlled Robot

- 1 The really (in)famous precedent
- 2 The context
- 3 Racket & Mirto
- 4 Applications
- 5 Assessment & Evaluation**

- ① **Threshold level:** essential to pass the year.
- ② **Typical level:** expected for a good honours degree.
- ③ **Excellent level:** identifies outstanding achievements.

SOB ID	Level	Topic	SOB	Start Date	Expected Completion Date	Edit
1	Threshold	Racket	Enter simple expressions, including nested brackets and symbols bound to values into the interaction window, execute them and explain what is happening. <b>Keywords</b> : expression   binding   block 1	07.10.2013	18.10.2013	
2	Threshold	Racket	Use simple list commands including list, first, rest, cons, reverse, length and append to solve problems posed in a very explicit way. <b>Keywords</b> : lists   block 1	14.10.2013	25.10.2013	
3	Threshold	Racket	Use define, lambda and cond, with other language features as appropriate, to create and use a simple function. <b>Keywords</b> : define   lambda   cond   block 1	14.10.2013	25.10.2013

## Typical

Figure : Student view: position with respect to class

# Evaluation & Conclusion

- 85% success rate
- Average 90% attendance
- All students have progressed beyond threshold SOBs
- <https://github.com/fraimondi/myrtle/>  
(software and design files)

# Conclusion

Thanks and feel free to come and see MIRTO!
